

A Green Good News Story

Seven countries now generate 100 per cent of their electricity from renewable energy - two are in Europe.

The world installed 116 gigawatts of new wind power capacity in 2023, according to the latest Global Wind Report from industry trade association the Global Wind Energy Council (GWEC). That is a 50 per cent increase from 2022 making it the best year on record for new wind projects.

China led for both offshore and onshore wind installation followed by the US, Brazil and Germany. Thanks to **strong growth in the Netherlands**, Europe also had a record year in 2023 with 3.8 gigawatts of new offshore wind capacity.

The report notes that, while wind power growth is highly concentrated in a few big countries, some other regions and nations saw record growth. Africa and the Middle East installed nearly 1 gigawatt of wind power capacity in 2023, almost triple that of the previous year.
